Mr. Brad Bradley
Remedial Project Manager
U.S. EPA/Region V
230 S. Dearborn
Chicago, IL 60604

Dear Mr. Bradley:

In regards to our June 5, 1991 phone conversation in which we discussed the Draft Scope of Services for the NL Industries/Taracorp Pre-Design Work (dated May 3, 1991; received May 6-8, 1991, and responded June 1, 1991); it has been determined by our management that stainless steel (not PVC) should be the material used in the monitoring well construction if volatiles are to be analyzed for in the groundwater. I have attached the agency policy which spells out these specifications. A hybrid well of PVC/stainless steel construction could be used, as long as the stainless steel portion is in the saturated zone.

If you have any questions or comments regarding this requirement, you can either contact me or our sub-unit manager, Steve Davis, at the above number.

Sincerely,

A handwritten signature in cursive script that reads "Shirley Baer".
